

GONZAGA, SOFIA LORRAINE

BSIT 4A

Personal Reflection on Week 2:

1. What Did You Learn?

- I learned that system administration encompasses more than installing a software application. The process of the enterprise administration includes analysis of processes, security procedures, costs, and future plans. The most useful part of doing the activity was to plan the enterprise network topology. It gave me the experience to understand how routing gateways, firewalls, and managed switches all work together to ensure the security of data and the optimized routing of packets across different departments of the business. I also learned an important lesson of creating technically accurate design before the real implementation as a whole.

2. Which task was most challenging?

- However, the greatest challenges experienced while carrying out this activity included finding a balance between strict budgetary limits and high hardware requirements for software development, maintaining security of the network to ensure that all the guests and sales are kept away from HR and Finance data, securing vital information from any power interruptions or failure of hardware systems, and ensuring that cable arrangement is scalable in the future.

3. Why is planning important before deployment?

- Planning is important before deployment to prevent failures, security threats and vulnerabilities, and unexpected downtime. Setting up a network infrastructure is critical as it serves the blueprint for execution. Planning also improves scalability and long-term maintenance ensuring system can handle higher loads without interrupting any hardware components.

4. How will this project help you become a better System Administrator?

- The experience that I am going to gain in the course of carrying out this project is going to be beneficial to me as a System Administrator because of helping me understand how to come up with an IT infrastructure design that incorporates business needs and at the same time making sure that the infrastructure is safe, secure, and scalable. This is achieved through considering issues such as budgeting for hardware, segmentation of networks for security reasons, business continuity plans, and physical scalability.
